AutomataCore Labs

PROCESS CONSULTING FOR OPERATIONS TEAMS

Business Process Optimization

We make your existing processes faster – before you spend a single euro on a new tool.

www.automatacore-labs.com

/ THE ENGAGEMENT

Six steps. Stakeholders in every one of them.

1. **Select**
   Choose the process worth the effort, scored on impact against effort.
2. **Model**
   Map it as it actually runs—not as the manual describes it.
3. **Redesign**
   Propose changes and simulate them against the whole chain, not a fragment.
4. **Validate**
   Verify the gain against the baseline and get the change formally approved.
5. **Implement**
   Roll out with the people who do the work, not around them.
6. **Monitor**
   Measure after go-live. Keep what holds up, revert what does not.

Stakeholders are included, not consulted. The person who knows why Step 3 exists is in the room from Step 1.

/ HOW WE WORK

Four principles govern every engagement.

01

Process comes first

We model and fix the process before any tool is discussed. Technology laid over a broken process only makes the mess run faster.

02

Exhaust the tool you own

No new tool until the current one is used to its full potential. Most 'missing features' turn out to be unused features.

03

Extensible tools, sharp use cases

When a new tool is justified we pick narrow tools that do one job well and expose an interface—not suites that promise everything and integrate with nothing.

04

Prove the gain

Same or better quality in less time, or better quality in the same time. Measured against a baseline we take before we touch anything.

/ WHAT CHANGES

What you get back.

Measured against the baseline we take before the first change—so the gain is a number you can put in a board pack, not a feeling.

THE PROMISE

Same or better quality in less time, or better quality in the same time.

Time returned to skilled people
Capacity moves off routine handling and onto work that needs judgement.

Higher data quality
One point of capture means one place to be right, and one place to fix.

Less coordination overhead
Fewer handoffs, fewer chase-up emails, fewer status meetings.

Predictable throughput
A standardized process absorbs volume spikes instead of buckling under them.

Lower cost per unit of output
The same team delivers more, without working longer.
